# Table of Contents

- 1 Protocol

- Group of IPv6 actors in France (researchers, engineers. . .)
- Academic & industrial partners
  - CNRS, Institut TELECOM, INRIA, Universities. . .
  - AFNIC, 6Wind, Bull. . .
- Launched in 1995 by:
  - Alain Durand
  - Bernard Tuy
- Is today a legal association under French Law (1901)
  - Laurent Toutain, President
- For further information: <http://www.g6.asso.fr/>

- Share experience gained from IPv6 experimentations and deployment
- Spread IPv6 information
  - Tutorials and trainings (ISPs, Engineers, netadmins. . .)
  - Online book (in French), "IPv6, Théorie et pratique":  
<http://livre.g6.asso.fr/>
- Initiate research activities around IPv6
- Active in RIPE & IETF working groups
- Promotion of IPv6: French Task Force

# Hypertext Symbols

Protocol

- Several symbols are used in this document:
  - All RFCs and Internet Drafts are hypertext links.
    - Check that there is no more recent version of the document.
  -  is a link to a *Techniques de l'Ingénieur* article on the subject (in French, access may be restricted).
  -  is a link to the online edition of *IPv6, Théorie et Pratique* (in French)
  -  is a link to other information on the web.
- Material concerning IPv6 is taken from the G6 tutorial and copyrighted from G6.

Protocol

IPv6 Header

# IPv6 Packet : Simpler

## Protocol

IPv6 Header  
IPv6 Header  
IPv6 Extensions  
ICMPv6  
Impact on Layers  
4

### Definition

- IPv6 header follows the same IPv4 principle:
  - fixed address size ... but 4 times larger
  - alignment on 64 bit words (instead of 32)
- Features not used in IPv4 are removed
- Minimum MTU 1280 Bytes
  - If L2 cannot carry 1280 Bytes, then add an adaptation layer such as AAL5 for ATM or 6LoWPAN ([RFC 4944](#)) for IEEE 802.15.4.

### Goal :

- Forward packet as fast as possible
- Less processing in routers
- More features at both ends

## Flow Label (RFC 3697): Why?

### Protocol

IPv6 Header  
IPv6 Header  
IPv6 Extensions  
ICMPv6  
Impact on Layers  
4

- A flow is a sequence of packets that should receive specific non-default handling from the network
  - For instance : 5-tuple of the same source/destination address/port and transport protocol values
- The Flow Label field is designed to enable classification of packets belonging to a specific flow
  - Without the flow label the classifier must use transport next header value and port numbers
    - Less efficient (need to parse the option headers)
    - May be impossible (fragmentation or IPsec ESP)
- A flow is a unique identifier (for the source)
  - Flow label + source address is unique
  - Reduce processing time by 2-4 times in IPv4 and 3-6 times in standard IPv6
  - After a silence of 120 seconds, packets are not assumed to belong to the same flow

## Flow Label: Why not?

### Protocol

IPv6 Header  
IPv6 Header  
IPv6 Extensions  
ICMPv6  
Impact on Layers  
4

- When IPv6 started to be designed:
  - RSVP was forecast to allow end-to-end micro flows reservation.
  - Short path for ATM VC
- With DiffServ, aggregation inside provider network is preferred:
  - Macro flows (e.g. from an ingress to an egress router)
  - Different sources, possibility of no common bits in the header
- Providers do not have to look at flow label to identify macro-flows
  - Only hosts have to do it, and they « have time » to look at port numbers
  - Firewalls cannot use Flow Label to take decisions

Protocol

IPv6 Extensions

## Extensions

Protocol

IPv6 Header

IPv6 Header

IPv6 Extensions

ICMPv6

Impact on Layers

4

- Seen as a L4 protocol
- Processed only by destination
  - Except Hop-by-Hop processed by every router
  - Equivalent of option field in IPv4
- No size limitation
- Several extensions can be linked to reach L4 protocol
- Processed only by destination
  - Destination (mobility)
  - Routing (loose source routing, mobility)
  - Fragmentation
  - Authentication (AH)
  - Security (ESP)

4

- Always first position
- Composed of options:

**Jumb**

Possible options:

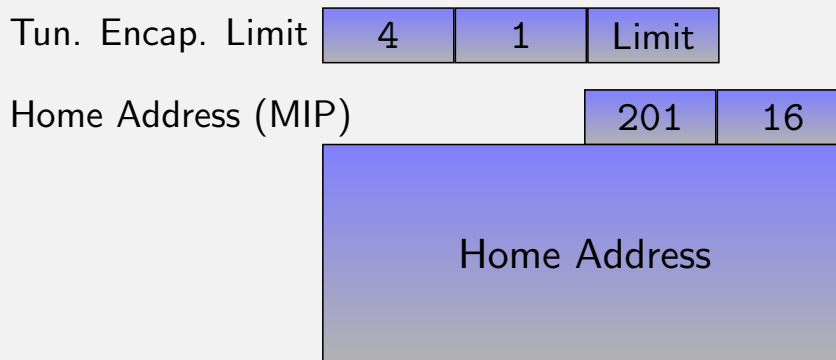

- 0: Multicast Listener Discovery (RFC 2710)
- 1: RSVP (RFC 2711)
- 2: Active Networks (RFC 2711)
- 4 to 35: Aggregated Reservation Nesting Level (RFC 3175)
- 36 to 67: QoS NSLP Aggregation Levels 0-31 (draft-ietf-nsis-qos-nslp-18.txt)

# Destination (NH=60)

## Protocol

IPv6 Header  
IPv6 Header  
IPv6 Extensions  
ICMPv6  
Impact on Layers  
4

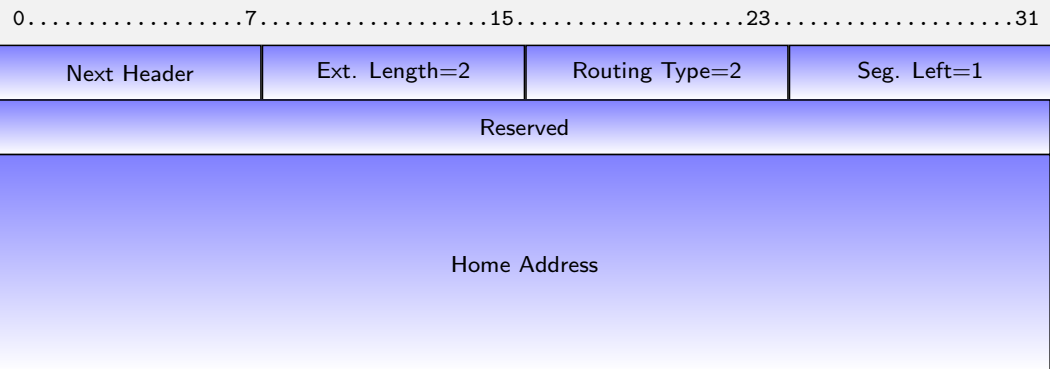

- Tunnel Encapsulation Limit (RFC 2473): the maximum number of nested encapsulations of a packet. When it reaches 0, the packet is discard and an ICMPv6 message is sent.
- Home Address (RFC 3775): Contains the Home Address of the sender (IPv6 header contains the Care-of Address).

# Routing (NH=43)

- Impact on Layers 4

# Fragmentation (NH=44)

## Protocol

- IPv6 Header
- IPv6 Header
- IPv6 Extensions**
- ICMPv6
- Impact on Layers 4

- Compared to IPv4, it is equivalent to DF=1
- A Router never fragments packets but sends an ICMPv6 message ("Packet Too Big") with the expected size
- The Sender either uses the fragmentation extension or adapts TCP segments

## Protocol ICMPv6

## ICMPv6

### Protocol

IPv6 Header  
IPv6 Header  
IPv6 Extensions  
ICMPv6  
Impact on Layers  
4

- ICMPv6 is different from ICMP for IPv4 ([RFC 4443](#))
  - IPv6 (or extension): 58
- Features are extended and better organized
- **Never filter ICMPv6 messages blindly, be careful to what you do (see [RFC 4890](#))**

### Format :

0.....7.....15.....23.....31

### Precision

*type* code nature of the message ICMPv6  
*code* specifies the cause of the message ICMPv6  
*mandatory checksum* used to verify the integrity of ICMP packet

# ICMPv6 : Two Functions

Impact on Layers  
4

IPv6 is almost transparent for Layer 4 protocol, except:

- Jumbogram impact:
  - UDP: if Jumbogram are used and  $length > 65535 \Rightarrow$  UDP.length = 0 and use Jumbogram length
  - TCP: Use PMTU if  $Length > 65535$
- UDP-Light: For multimedia flow a bit error is less important than a packet loss. UDP-light is used to not include UDP payload in L4 Checksum.
- SCTP: during session initialisation, IPv4 and IPv6 addresses are exchanged.
